

Supplementary File 1. Key words used in the search.

We used a three-tier search strategy to identify eligible studies. At the first stage, keywords related to psychosocial job stressors and working contexts were combined ("job stress*" OR "psychosocial job stress*" OR "working condition*" OR "psychosocial NEXT/2 work*" OR "psychosocial NEXT/2 job*" OR "occupation* NEXT/2 stress*" OR "psychosocial NEXT/2 stress*" OR "work* NEXT/2 stress*").

We then searched for common terms for psychosocial job stressors: ("job control" OR "job demands" OR "job secur*" OR "job insecur*" OR "work insecur*" OR "work secur*" OR "precar* NEXT/2 work" OR "precar* NEXT/2 employ*" OR "precar* NEXT/2 job" OR "decision latitude" OR "skill discretion" OR "decision authority" OR "psychological demands" OR "social support" OR "workload" OR "effort\$reward imbalance*" OR "organ* NEXT/2 justice" OR "organ* NEXT/2 injustice" OR "work* NEXT/2 hour*" OR "work* NEXT/2 time" OR "temp* NEXT/2 employ*" OR "work NEXT/2 leadership" OR "job NEXT/2 strain")

At the third stage, we searched for keywords inclusive of self-harm or suicide (e.g., "self\$harm" OR suicid* OR "attempted suicid*" OR parasuicid* OR "intentional\$self\$harm" OR "drug overdos*" OR "auto\$mutilat*" OR "self\$cutt" OR "self\$destructive behavio*" OR self\$poison* OR self\$mutilat* OR self\$injur* OR "suicid* thought*" OR "suicide* idea*"). We then conducted a search incorporating the search terms from tiers one, two and three using standard Boolean operators.
