(Review in a later issue is not precluded by notice here of books recently received.)

Epilepsy. By Letitia Fairfield. (Pp. 159. 8s. 6d.) London: Gerald Duckworth. 1954.

Correction.—Dr. Goldblatt much regrets that in his Mackenzie Lecture (British Journal of Industrial Medicine, 12, 1) he has made one error. He writes:—

"The trouble lies on page 6, the last paragraph in the first column, and in the second sentence which commences with 'Recent Investigation'. It should read:

"Recent investigations in my laboratories have confirmed that N₂O₄, which is probably the chief toxic constituent of the notorious 'nitrous fumes', can produce pulmonary oedema and haemorrhage. In the presence of ozone, however, N₂O₄ is converted to the much more toxic N₂O₅, which is a lung irritant of about the same order of potency as phosgene."
