Objectives Sugarcane harvesters in Costa Rica are exposed to heat stress, a likely major risk factor in the Mesoamerican nephropathy epidemic. Routine urinalyses provide important information about kidney function, but have not been reported in detail for this population.

Method Sugarcane cutters (n = 48) provided six spot urine samples, pre- and post-workshift for three days during one week in mid-harvest. Chemical analyses with dipstick and microscopic examinations of sediment were performed. Changes over the workday in markers for hydration status and kidney responses to heat stress were evaluated with McNemar test on paired proportions.

Results Preliminary results indicate percentages of workers with specific parameters in at least one morning versus in at least one afternoon sample were with dipstick: pH ≤ 5.30% vs 82%, specific gravity ≥ 1.025 30% vs 51%, proteinuria (1+ and up) 86% vs 8%, and blood (traces and up) 28% vs 12%; and in sediment: >5 leucocytes 76% vs 57%, >3 erythrocytes 50% vs 37%, and casts (granular, leukocyte and some erythrocyte) 75% vs 39%. Except for erythrocytes in sediment, these differences were statistically significant.

Conclusions Concentration and acidification of urine over the workday indicate insufficient hydration. Positive blood on dipstick may be a sign of low-grade hematuria or mild rhabdomyolysis. Predominance of proteinuria, leucocytes, erythrocytes and casts in morning urine was unexpected but may reflect improvement in glomerular filtration with hydration overnight or, alternatively, effects from vasopressin at night. This study adds to an increasing body of evidence of kidney dysfunction among heat stress exposed sugarcane workers.

INTEGRATING MORE DETAILED EXPOSURE ASSESSMENT WITH QUANTITATIVE ESTIMATES IS ASSESSING THE BURDEN OF OCCUPATIONAL CANCER

1,2Paul Demers, 3,4Cheryl Peters, 5Hugh Davies, 6Joanne Kim, 7Marisha Paiva, 8Chris McLeod, 9Anne-Marie Nicol, 10France Labreche, 11Jerome Lavoue, 12Sally Hutchings, 13Lesley Rushton, 14Occupational Cancer Research Centre, Toronto, Canada; 15University of Toronto, Toronto, Canada; 16CAREX Canada, Vancouver, Canada; 17University of British Columbia, Vancouver, Canada; 18Simon Fraser University, Vancouver, Canada; 19Institut de Recherche Robert-Sauvé en Santé Et en Sécurité Du Travail, Montreal, Canada; 20Université de Montreal, Montreal, Canada; 21Imperial College, London, UK

Objectives In recent years, several new burden projects have been initiated with increased methodological sophistication. Previous studies have varied with respect to methods used to identify the prevalence and relevant levels of exposure, but many have relied on CAREX estimates. In this presentation, we will focus on the impact of incorporating more detailed exposure assessments with quantitative estimates as part of the Canadian burden of cancer project.

Method The Canadian exposure estimation process relies on data from CAREX Canada, taking into account industry and occupation at a more detailed level than previously. For many common carcinogens, the Canadian Workplace Exposure Database is used to account for changes in exposure levels over time and quantitative exposure-response relationships from the literature are used to assign relative risks relevant to the mean level of each exposure group. Historical employment trends are based upon census data at multiple time-points with province, sex, industry, and occupation detail.

Results Developing estimates for approximately 300 industries, as well as by occupation, and the need for estimating the age and gender characteristics of predicted cases to estimate economic burden, has also increased the complexity of estimating historic labour force dynamics. Annual labour force data 1976–2010 is used to attribute age- and tenure-distribution characteristics by province, sex, and industry.

Conclusions Although our main objective was to increase the validity of the burden estimation process, the more detailed exposure estimates allow us to calculated cancer burden for much more specific industry sectors and occupations, allowing for detailed risk reduction strategies.
