industrial fields. Our aim in this study is to draw attention to the increasing number of health problems of forklift operators, caused by working conditions and by structural and functional features of the machines.

**Material and Method** 140 forklift operators working in industrialised cities of Marmara region were included in the study. As a control group, 140 workers from the same working fields and with similar demographic features were included. All the participants were male and married. Necessary ethical permission was obtained. The first section described the demographic properties of the workers; the second and third sections contained the information about health problems of applied questionnaire.

**Results** The significant differences in this study, which was conducted on a questionnaire basis, were the number of pre-term deliveries, FGR (fetal growth restriction), interval to conceive, the number of stillbirths, congenital abnormalities and newborn malignancies. In addition, the incidence of musculoskeletal system disorders, chronic diseases and the incidence of being under treatment currently were also significantly higher among forklift operators.

**Conclusion** Related to occupational environment, structural and functional features of the machines used, physical and chemical risk factors, there is an adverse impact on the health of forklift operators the number of whom are increasing every day because of industrialization. The results have achieved shows that the studies evaluating reproductive health and musculoskeletal system of the forklift operators should continue incrementally.

**0023 A PROSPECTIVE COHORT STUDY OF THE IMPACT OF RETURN-TO-WORK COORDINATORS IN GETTING INJURED WORKERS BACK ON THE JOB**

1Tyler Lane*, 2Rebecca Lilley, 3Shealah Hogg-Johnson, 4Tony LaMontagne, 5Malcolm Sim, 6Peter Smith. School of Public Health and Preventive Medicine, Melbourne, Victoria, Australia; 2Institute for Safety, Compensation and Recovery Research, Monash University, Melbourne, Victoria, Australia; 3Dunedin School of Medicine, University of Otago, Dunedin, New Zealand; 4Institute for Work and Health, Toronto, Ontario, Canada; 5Dalla Lana School of Public Health, University of Toronto, Toronto, Ontario, Canada; 6Centre for Population Health Research, Deakin University, Melbourne, Victoria, Australia

**Background** Globally, 313 million missed at least four days of work in 2010 due to a work-related injury. Extended periods of work absence are costly and associated with poor health outcomes. Interventions that include return-to-work (RTW) Coordinators improve RTW outcomes, though they have often been investigated as part of a larger intervention package. We investigated whether Coordinator impact varies based on the stressfulness of interactions and whether it goes above and beyond functional aspects of their role and other workplace factors.

**Methods** A prospective cohort study of 632 workers in Victoria, Australia with more than ten days of compensation due to work-related injury. Participants rated the stressfulness of their Coordinator interactions, dichotomised into good and poor, and said whether they had a RTW plan. RTW plans are a functional responsibility of Coordinators. We analysed responses at baseline and six-month follow-up using logistic regression analyses, adjusting for demographic and workplace factors.

**Results** At baseline, RTW plans doubled odds of RTW and attenuated the impact of good Coordinator interactions, which had been associated with better RTW outcomes. At follow-up, the reverse was found: good interactions doubled odds of RTW while RTW plans were non-significant.

**Conclusions** The findings suggest that different aspects of Coordinator intervention have varied impacts on injured workers’ RTW outcomes depending on their trajectory. Functional benefits improved outcomes among shorter-duration claims, while interpersonal intervention improved outcomes among longer-duration claims. There are implications for how Coordinators target and interact with injured workers and other ways of improving their effectiveness.

**Declaration of potential conflict of interest:** I (Tyler Lane) receive salary support from WorkSafe Victoria through a grant for another project, the Compensation and Return to Work Effectiveness (ComPARE) Project. All participants were WorkSafe clients, and WorkSafe conducted initial recruitment.

**0024 THE OCCUPATIONS AT INCREASED RISK OF COPD IN THE UK BIOBANK COHORT**

1Sara De Matteis*, 2Deborah Jarvis, 3Andrew Darnton, 4David Fishwick, 5Lesley Rushton, 6Paul Cullinan. 1School of Public Health and Preventive Medicine, Melbourne, Australia; 2Dunedin School of Medicine, University of Otago, Dunedin, New Zealand; 3Institute for Work and Health, Toronto, Ontario, Canada; 4Centre for Health and Safety Executive, Bootle, UK

**Background** Globally, 313 million missed at least four days of work in 2010 due to a work-related injury. Extended periods of work absence are costly and associated with poor health outcomes. Interventions that include return-to-work (RTW) Coordinators improve RTW outcomes, though they have often been investigated as part of a larger intervention package. We investigated whether Coordinator impact varies based on the stressfulness of interactions and whether it goes above and beyond functional aspects of their role and other workplace factors.

**Aims and objectives** Our aim was to develop these findings using lifetime job-histories to identify occupations at increased COPD risk, taking into account potential confounders.

**Methods** We used OSCAR, an online tool that automatically codes full job-histories using the UK Standard Occupational Classification (SOC) v.2000 (De Matteis, S. et al. SJWEH 2016). In 2016 we administered OSCAR to all UK Biobank participants with an email address (n=324,653). All paid jobs of >6 months duration, were collated and coded. COPD was confirmed by positive exposure-response trends, and in analyses restricted to never-smokers and never-asthmatics. In comparison with our findings for current occupation, some associations were confirmed (e.g. food/drink/tobacco processors: PR 1.70;95% CI:1.17–2.48) while others emerged (e.g. plastics processors: PR 1.86;95% CI:1.09–3.17; agriculture/fishing: PR 1.76;95% CI:1.22–2.55).
Abstracts

Conclusions In order to focus workplace preventive strategies, we are in the process of applying a job-exposure matrix to identify the underlying occupational respiratory hazards.

Dusts and Fibres

0026 Development of a New Preparation Method of Human Lung Tissues for Analysing Asbestos Fibres by TEM

Characterisation and quantification of asbestos fibres in human lung tissues are critical for assessing occupational environmental exposures and epidemiological studies of asbestos related disease. To develop a reliable preparation method of human lung tissues for TEM-EDXA analysis, three conventional preparation methods and a new method were compared. Tissue preparation methods compared were; 5% NaOCl(digestion I), 40% KOH(digestion II), a low temperature plasma(ashing), and the new proposed method of 30% H2O2 digestion followed by a low temperature plasma (sequential application of the digestion andashing). After treatment, aliquot of samples were filtered and filters were carbon coated and jaffe washed for TEM analysis. A total of 90 human tissues were tested for comparison.

Results showed that the digestion I method could not detect asbestos fibres because of using limited amount of aliquot sample for analysis. For the digestion II method, organic materials were not completely removed which obscured the images of the asbestos fibres. For the ashing method, clear background images were obtained but some tremolite asbestos fibres were found to be damaged, either bent or broken. Using the proposed method, asbestos fibres were detected clearly and no fibres were damaged.

In summary, we proposed a new preparation method for treating asbestos fibres in the human lung tissues for TEM analysis. Not only showed it a superior quality for asbestos fibres detection but also no damages on asbestos fibres observed. Therefore, we are confident that it can be utilised for preparing human lung tissues for TEM analysis.
