Results Preliminary results indicate that associations between individual-level estimates of psychosocial work factors with depressive symptoms were largely linear and statistically significant. The associations of JEM estimates of psychosocial job factors with depressive symptoms showed varied patterns of non-linearity and were generally not statistically significant, after adjustment for individual-level measures.

Discussion Our study indicates that individual estimates of psychosocial work factors are consistently, strongly and linearly associated with depressive symptoms, whereas JEM estimates showed varied and non-linear patterns. JEM psychosocial work estimates may capture different phenomena than individual-level estimates.

Musculoskeletal

PREVALENCE OF WORK-RELATED MUSCULOSKELETAL DISEASES AND DISABILITY IN CONSTRUCTION WORKERS IN ANKARA

Necvan Tokmak*, Selim Yuksel, Deniz Caoussoglou, Zerrin Ulu, Cemil Tuna, Mustafa Unaldi, Ahmet Ozlu, Mustafa Kemal Basarali, Frank Van Dijk, Ali Naci Yildiz. Public Health Institution of Turkey, Ankara, Turkey; Public Health Directorate of Kocaeli, Kocaeli, Turkey; Public Health Directorate of Ankara, Ankara, Turkey; Public Health Institution of Turkey, Ankara, Turkey; Public Health Institution of Turkey, Ankara, Turkey; Public Health Directorate of Ankara, Ankara, Turkey; Public Health Institution of Turkey, Ankara, Turkey; Public Health Institution of Turkey, Ankara, Turkey; University in Amsterdam, Amsterdam, The Netherlands; Hacettepe University, Ankara, Turkey

Objectives Musculoskeletal diseases (MSD) affect almost 30% of the global construction sector workforce. Recent studies have shown high risks in bricklayers, plasterers and carpenters. The main causes of MSD in construction workers are heavy lifting, repetitive movements and poor ergonomic working postures. However, there are no studies in Turkey assessing work-related MSD prevalence in the construction sector and related disability in work and daily life.

The aim of this study is to examine the prevalence of musculoskeletal symptoms in manual handling construction workers in the construction of new buildings for a city hospital in Ankara. The study includes assessing the work-relatedness of MSD. Subsequently the effect of MSD on disability is analysed.

Methods We plan a cross-sectional study using a questionnaire on sociodemographic characteristics, risk factors at work and employment conditions, work history, health status, the Nordic Musculoskeletal Questionnaire and disability as a consequence of work-related MSD, using a face-to-face interview method. The interviews will be performed by trained occupational health and safety specialists from the Public Health Institution of Turkey (PHIT).

Discussion Our study indicates that individual estimates of psychosocial work factors are consistently, strongly and linearly associated with depressive symptoms, whereas JEM estimates showed varied and non-linear patterns. JEM psychosocial work estimates may capture different phenomena than individual-level estimates.

Respiratory

AIR POLLUTANTS ASSOCIATED WITH BASELINE IN FRACTIONAL EXHALED NITRIC OXIDE (FENO) IN SCHOOL CHILDREN

Tzu-Pei Wang*, Chi-Hsien Chen, Shing-Yu Chen, Yue-Leon Guo. Institute of Occupational Medicine and Industrial Hygiene, National Taiwan University, Taipei, Taiwan; Department of Environmental and Occupational Medicine, National Taiwan University College of Medicine and NTU Hospital, Taipei, Taiwan

Objectives We planned that 1,200 people will be included in the study. The prevalence of work-related MSD and disability will be determined, stratified for occupational groups and sociodemographic variables.

Conclusion The main outcome is prevalence of work-related MSDs in construction workers studied and related disability in work and daily life. Interventions will be recommended for prevention.

Methodology

0260 VISUALISING THE UNEMPLOYMENT-TO-EMPLOYMENT TRANSITIONS TO EXPLORE FACTORS INFLUENCING RETURN TO WORK IN THE WORK PROGRAMME: RESULTS FROM THE SUPPORTING OLDER PEOPLE INTO EMPLOYMENT (SOPIE) COHORT

1Judith Brown*, 2Ronald McQuaid, 3Srinivasa Vittal Katikireddi, 4Alastair Leyland, 5John Frank, 6Oarabile R Molaodi, 7Ewan B Macdonald. 1Healthy Working Lives Group, Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK; 2Stirling Management School, University of Stirling, Stirling, UK; 3MRC/CSO Social and Public Health Sciences Unit, Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK; 4Scottish Collaboration for Public Health Research and Policy, University of Edinburgh, Edinburgh, UK

Objectives Returning to employment after a period on welfare benefits is particularly challenging for people aged over-50 and those with health conditions. We explore the unemployment-to-employment transitions made by clients engaging with the Work Programme (WP); the UK Government’s main return to work (RTW) initiative. It supports two main groups of welfare benefit claimants - JSA, for people who are unemployed but capable of work; ESA, for people with a disability that makes it more difficult to work.

Methods The data were from the SOPIE cohort (13 461 unemployed clients aged 18–64, who entered the WP in Scotland between April 2013 and July 2014). For clients who started a job, unemployment and employment spells during their two-year period in the WP were determined and sequence index plots produced using Stata version 14. These visualisations were explored by age and benefit type.

Results Job start rates were: ‘JSA clients under-50’, 65%; ‘JSA clients over-50’, 49%; ‘ESA clients under-50’, 23%; ‘ESA clients over-50’, 14%. Despite the lower numbers of ESA clients with a job start the visualisations revealed that these clients (both under and over-50) were as likely to sustain employment as JSA clients. Analyses also investigated employment by Standard Occupational Classification and full versus part-time.

Conclusions Visualising longitudinal employment data provides new insight into the relationship between age, health and the RTW process. Although people receiving health-related benefits (ESA) enter employment at lower rates, they can sustain employment similarly to JSA clients, suggesting support for policies aiming to reduce the disability employment gap.

Shift Work

0261 THE EFFECTS OF NIGHT WORK AND LIGHT EXPOSURE ON SALIVARY MELATONIN CONCENTRATION DURING WORK DAYS AND DAYS OFF

1Stine Daugaard*, 2,3Anne Helene Garde, 4Jens Peter Bonde, 5Jens Christoffersen, 6Aase Marie Hansen, 7Jakob Markvart, 2,5Vivi Schlünsen, 8Debra Skene, 1Helene Tilma Vistisen, 9Henrik Kolstad. 1Department of Occupational Medicine, Danish Ramazzini Centre, Aarhus University Hospital, Aarhus, Denmark; 2National Research Centre for the Working Environment, Copenhagen, Denmark; 3Institute of Public Health, Copenhagen University, Copenhagen, Denmark; 4Department of Occupational Medicine, Bispebjerg Hospital, Copenhagen, Denmark; 5Stakeholder Communications and Sustainability, VELUX, Hardholt, Denmark; 6Department of Energy Performance, Indoor Environment and Sustainability of Buildings, Danish Building Research Institute, Aalborg University, Copenhagen, Denmark; 7Department of Public Health, Aarhus University, Aarhus, Denmark; 8Chronobiology, Faculty of Health and Medical Sciences, University of Surrey, Guildford, UK

Objectives We aimed to examine the effects of night work on salivary melatonin concentrations during and subsequent to night work and the mediating role of light.

Methods We included 254 day workers and 87 night workers that were followed during 322 work days and 301 days off work. Each day was defined as the 24 hour period starting from the beginning of a night shift or awakening in mornings with daytime work and days off. Light levels were recorded and synchronised with diary information on start and end of sleep and work. On average, participants provided four saliva samples per day, and these were analysed for melatonin concentration. Differences between day and night workers on work days and days off were assessed with multilevel regression models with melatonin concentrations as outcome. All models were stratified or adjusted by time of the day. For light exposure, we estimated the total, direct, and indirect effects of night work on melatonin concentrations obtaining 95% confidence intervals trough bootstrapping.

Results On work days, night workers showed 16.5% (95% CI 0.2; 30.5) lower salivary melatonin concentration compared with day workers. Light exposure seemed to mediate about 40% of the melatonin suppression seen during night, but no mediating effect of light was seen during day time. On days off, we observed no difference in melatonin concentration between night and day workers.

Conclusion These findings are in accordance with a transient and partly light mediated effect of night work on melatonin concentration.
