Results Preliminary results indicate that associations between individual-level estimates of psychosocial work factors with depressive symptoms were largely linear and statistically significant. The associations of JEM estimates of psychosocial job factors with depressive symptoms showed varied patterns of non-linearity and were generally not statistically significant, after adjustment for individual-level measures.

Discussion Our study indicates that individual estimates of psychosocial work factors are consistently, strongly and linearly associated with depressive symptoms, whereas JEM estimates showed varied and non-linear patterns. JEM psychosocial work estimates may capture different phenomena than individual-level estimates.

Musculoskeletal

Preliminary results indicate that associations between individual-level estimates of psychosocial work factors with depressive symptoms were largely linear and statistically significant. The associations of JEM estimates of psychosocial job factors with depressive symptoms showed varied patterns of non-linearity and were generally not statistically significant, after adjustment for individual-level measures.

Discussion Our study indicates that individual estimates of psychosocial work factors are consistently, strongly and linearly associated with depressive symptoms, whereas JEM estimates showed varied and non-linear patterns. JEM psychosocial work estimates may capture different phenomena than individual-level estimates.

Objective Musculoskeletal diseases (MSD) affect almost 30% of the global construction sector workforce. Recent studies have shown high risks in bricklayers, plasterers and carpenters. The main causes of MSD in construction workers are heavy lifting, repetitive movements and poor ergonomic working postures. However, there are no studies in Turkey assessing work-related MSD prevalence in the construction sector and related disability in work and daily life.

The aim of this study is to examine the prevalence of musculoskeletal symptoms in manual handling construction workers active in the construction of new buildings for a city hospital in Ankara. The study includes assessing the work-relatedness of MSD. Subsequently the effect of MSD on disability is analysed.

Methods We plan a cross-sectional study using a questionnaire on sociodemographic characteristics, risk factors at work and employment conditions, work history, health status, the Nordic Musculoskeletal Questionnaire and disability as a consequence of work-related MSD, using a face-to-face interview method. The interviews will be performed by trained occupational health and safety specialists from the Public Health Institution of Turkey (PHIT).

Results The study proposal has been approved by the PHIT and the construction company. Workers will be asked for informed consent.

Discussion Our study indicates that individual estimates of psychosocial work factors are consistently, strongly and linearly associated with depressive symptoms, whereas JEM estimates showed varied and non-linear patterns. JEM psychosocial work estimates may capture different phenomena than individual-level estimates.

Respiratory

Fractional exhaled nitric oxide (FeNO) is now recognised as a surrogate marker of eosinophilic airway inflammation and is affected by several factors, air pollution is an environmental determinant of it. Previous studies provide evidence that children are sensitive to the effects of air pollution. Therefore, the main objective of this study is to determine the effects of ambient air pollution on exhaled NO levels among school children.

From March 2016 to March 2017, a nationwide cross-sectional study was conducted in Taiwan using a modified Chinese version of the International Study of Asthma and Allergies in Childhood (ISSAC-C) questionnaire. Children received FeNO measurement in the morning, and inside buildings. Air pollution data were retrieved from air monitoring stations within two kilometre of the schools.

From 37 schools, 3344 students aged 6–15 years were randomly selected as candidates of the study. We complete monitoring data of air pollution, including SO2, O3, CO, NO2, PM2.5 and PM10. Our preliminary results showed that the levels of FeNO were significantly (p<0.05) associated with average CO (0.48±0.4 ppm), NO (5.48±10.21 ppb), PM2.5 (20.96±14.27 μg/m3), and PM10 (46.44±22.78 μg/m3) concentrations of lag day1. In summary, results indicated that exposure ambient pollutants might affect FeNO levels of schoolchildren. In order to further investigate, multilevel modelling will be used to distinguish the sources of variation in the response. We plan to evaluate variations among children in the first level, and variations among schools in the second level.

#### Methodology

**0260 VISUALISING THE UNEMPLOYMENT-TO-EMPLOYMENT TRANSITIONS TO EXPLORE FACTORS INFLUENCING RETURN TO WORK IN THE WORK PROGRAMME: RESULTS FROM THE SUPPORTING OLDER PEOPLE INTO EMPLOYMENT (SOPIE) COHORT**

1Judith Brown*, 2Ronald McQuaid, 3Srinivasa Vittal Katikireddi, 4Alastair Leyland, 5John Frank, 6Qanele R Molaodi, 7Ewan B Macdonald. 1Healthy Working Lives Group, Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK; 2Stirling Management School, University of Stirling, Stirling, UK; 3MRC/CSO Social and Public Health Sciences Unit, Institute of Health and Wellbeing, University of Glasgow, Glasgow, UK; 4Scottish Collaboration for Public Health Research and Policy, University of Edinburgh, Edinburgh, UK

Objectives Returning to employment after a period on welfare benefits is particularly challenging for people aged over-50 and those with health conditions. We explore the unemployment-to-employment transitions made by clients engaging with the Work Programme (WP); the UK Government’s main return to work (RTW) initiative. It supports two main groups of welfare benefit claimants - JSA, for people who are unemployed but capable of work; ESA, for people with a disability that makes it more difficult to work.

Methods The data were from the SOPIE cohort (13 461 unemployed clients aged 18–64, who entered the WP in Scotland between April 2013 and July 2014). For clients who started a job, unemployment and employment spells during their two-year period in the WP were determined and sequence index plots produced using Stata version 14. These visualisations were explored by age and benefit type.

Results Job start rates were: ‘JSA clients under-50’, 49%; ‘JSA clients over-50’, 65%; ‘ESA clients under-50’, 23%; ‘ESA clients over-50’, 14%. Despite the lower numbers of ESA clients with a job start the visualisations revealed that these clients (both under and over-50) were as likely to sustain employment as JSA clients. Analyses also investigated employment by Standard Occupational Classification and full versus part-time.

Conclusions Visualising longitudinal employment data provides new insight into the relationship between age, health and the RTW process. Although people receiving health-related benefits (ESA) enter employment at lower rates, they can sustain employment similarly to JSA clients, suggesting support for policies aiming to reduce the disability employment gap.

#### Shift Work

**0261 THE EFFECTS OF NIGHT WORK AND LIGHT EXPOSURE ON SALIVARY MELATONIN CONCENTRATION DURING WORK DAYS AND DAYS OFF**

1Stine Daugaard*, 2, 3Anne Helene Garde, 4, 5Jens Peter Bonde, 6Jens Christoffersen, 7Aase Marie Hansen, 8Jakob Markvant, 2, 8Vivi Schlinsø, 9Debra Skene, 3Helene Tilma Vistisen, 1Henrik Kildstad, 2Department of Occupational Medicine, Danish Ramazzini Centre, Aarhus University Hospital, Aarhus, Denmark; 3National Research Centre for the Working Environment, Copenhagen, Denmark; 4Institute of Public Health, Copenhagen University, Copenhagen, Denmark; 5Department of Occupational Medicine, Bispebjerg Hospital, Copenhagen, Denmark; 6Stakeholder Communications and Sustainability, VELUX, Hardholm, Denmark; 7Department of Energy Performance, Indoor Environment and Sustainability of Buildings, Danish Building Research Institute, Aalborg University, Copenhagen, Denmark; 8Department of Public Health, Aarhus University, Aarhus, Denmark; 9Chronobiology, Faculty of Health and Medical Sciences, University of Surrey, Guildford, UK

Objective We aimed to examine the effects of night work on salivary melatonin concentrations during and subsequent to night work and the mediating role of light.

Methods We included 254 day workers and 87 night workers that were followed during 322 work days and 301 days off work. Each day was defined as the 24 hour period starting from the beginning of a night shift or awakening in mornings with daytime work and days off. Light levels were recorded and synchronised with diary information on start and end of sleep and work. On average, participants provided four saliva samples per day, and these were analysed for melatonin concentration. Differences between day and night workers on work days and days off were assessed with multilevel regression models with melatonin concentrations as outcome. All models were stratified or adjusted by time of the day. For light exposure, we estimated the total, direct, and indirect effects of night work on melatonin concentrations obtaining 95% confidence intervals trough bootstrapping.

Results On work days, night workers showed 16.5% (95% CI 0.2; 30.5) lower salivary melatonin concentration compared with day workers. Light exposure seemed to mediate about 40% of the melatonin suppression seen during night, but no mediating effect of light was seen during daytime work. On days off, we observed no difference in melatonin concentration between day and night workers.

Conclusion These findings are in accordance with a transient and partly light mediated effect of night work on melatonin concentration.
