will increase the amount of data largely and the way the occupational hygienist will use this for exposure assessment.

But overseeing all of these changes, in the end, it will still be the question whether we as occupational hygienist are able to tell our stories in a way that companies and governments see the business relevance of our case. To get our business back on the political agenda we have to learn to communicate about risks in the right way and address our skill gaps.

1770c IRELAND'S REGULATORY FRAMEWORK ON OCCUPATIONAL SAFETY AND HEALTH: PREVENTION AND ENFORCEMENT, POLICY AND PRACTICE

M O'Halloran. *Health and Safety Authority, Ireland*

10.1136/oemed-2018-ICOHabstracts.679

An overview of the evolution of workplace safety and Health including wellbeing and mental health in workplaces in Ireland since 1989 with a particular focus on the period since 2005. I will outline the operational policy and practice of the Health and Safety Authority in terms of prevention and enforcement up to and including prosecution.

I will explore the legislative base, the information and advice platforms, our collaborative and partnership working, provision of tools to duty holders and proportionate risk based enforcement. The objective has been to raise awareness across the population and duty holders, to change behaviours, and to hold the non-compliant to account.

The Authority has developed a number of three year rolling strategies over the periods which have guided the development of annual programmes of work. The authority has been instrumental in developing some internationally recognised and acclaimed models and tools for implementing a preventive approach.

The authority has adopted the use of social media to promote the messages and has also become active in the national education systems to promote and train students so they are ready and competent with an appreciation of the duties of care owed to them when they enter the workforce.

We have also worked in a very collaborative and partnership manner engaging other state organizations as well as private sector representative groups including OSH community voluntary groups in promoting a common message and developing and implementing agreed action plans. Other aspects to be covered include research to underpin objective interventions, which are evidence based and evaluating their impacts.

I will review performance achieved over the period also outline the difficulties and challenges still facing the organisation which will require further work to achieve the sustained downward trend that is sought in occupational safety, health, wellbeing and mental health.

1770d TRENDS IN MUSCULOSKELETAL DISORDERS

Yushi Fujita. *The International Ergonomics Association*

10.1136/oemed-2018-ICOHabstracts.680

1770e THE STRUGGLE OF SOCIAL DIMENSION ON OCCUPATIONAL HEALTH WITH ENVIRONMENTAL AND ECONOMIC CHANGES

^{1,2}Park Doo Yong. ¹Department of Mechanical Systems Engineering, Hansung University, Seoul, Republic of Korea; ²Korea Occupational Safety and Health Agency

10.1136/oemed-2018-ICOHabstracts.681

Environmental and economic changes that have a great impact on occupational health will be reviewed both macroscopically and microscopically.

A macroscopic principle for a desirable national and societal system of occupational health and safety (OSH) will be introduced to define the social dimension and responsibility on OHS. In this perspective, it will be discussed:

1. the importance of social dimension of OHS;
2. the role of governmental and public sectors in the viewpoint of social dimension to change industry and commerce in response to calls for social and responsible business and OHS; and
3. countervailing forces for hope in the future.

1770f THE CASE OF RISING OCCUPATIONAL HEALTH STANDARDS IN SINGAPORE

HO Siong Hin. *International Association of Labour Inspection, and Commission for Workplace Safety and Health, Ministry of Manpower, Singapore*

Mining Occupational Safety and Health

1057 MERCURY EXPOSURE AND RELATED HEALTH PROBLEMS AMONG ARTISANAL AND SMALL SCALE GOLD MINING COMMUNITY IN CHUNYA DISTRICT TANZANIA

¹Simon Mamuya, ²Stanford Mwakitwange. ¹Muhimbili University of Health and Allied Sciences, Dar es Salaam, United Republic of Tanzania; ²District medical Officer, Chunya, Tanzania

10.1136/oemed-2018-ICOHabstracts.683

Background Human exposure to elemental mercury occurs mainly through inhalation of vapours, contact and ingestion through consumption of contaminated sea food.

Objective To assess the magnitude of health problems related to mercury exposure among artisanal and small scale gold mining community in Chunya District.

Methodology Analytical cross section study was conducted in gold mine community in Chunya District. A multistage random sampling method was used to recruit study participants from Saza and Makongorosi mining area recruited as exposed and individuals from two wards surrounding the mining area as unexposed group. Data was collected by a pre-tested interview schedule administered face to face to the interviewee

with both open and closed ended questions followed by urine sample collection which was then analysed by CVAAS technique to determine the level of mercury. Data analysis was done by using Chi-square and incase numbers were too small for Fisher's exact test was employed. Measure of association is significant where $p < 0.05$ Statistical analysis was done by SPSS version 21.

Results A total of 150 participants with the age between 15 and 67 (mean age 33.77 (SD=12.12) and 33.26 (SD=12.83) years old for exposed and unexposed groups respectively) were recruited and ascertained for exposure. Urinary mercury concentrations for exposed group were higher than the referent group (mean 81.18 (SD=46) mcgHg/g-creatinine and 5.14 (SD=2.73) mcgHg/g-creatinine respectively) ($p < 0.05$). Symptoms such as cough, chest tightness, tremor of hands, tremor of tongue, tremor of eyelid and trouble of walking were significantly more prevalent in exposed ($p < 0.05$) than non exposed.

Discussion Body burden caused by mercury affects not only miner but also the community surrounding the mining area. Exposure to even lower amount of mercury may bring about significant health effects. Therefore there is a need for stakeholders to raise the community awareness on mercury effects and its preventive measures.

1103 WHAT ARE WE DOING ABOUT CHILDREN MINING GOLD?

David F Goldsmith*. *George Washington University, Washington DC USA*

10.1136/oemed-2018-ICOHabstracts.684

Introduction There is concern in the Philippines, Indonesia, central Africa, and South America related to children's employment in small scale gold mines (SSGM). Ages range from 8 to 16 years, although statistics are lacking. We know children work in SSGM because they are poor; world gold prices keep them labouring. There is appeal to banning youth from mines, and creating no children in gold processing supply lines. These approaches appear to be the most ethical solutions, however this issue is more complex.

Definition of problem Evidence from Human Rights Watch indicates there are as many as 1,000,000 children in SSGM. There are risks of traumatic injury, dermatitis and diving risks in Philippines, lead poisoning in Africa, mercury (Hg) intoxication, and Hg contamination of local waters. There are remediation challenges, especially where mine tailings meet aquatic settings.

Environmental health results Local governments, NGOs, health providers, and mining companies must provide funding and alternatives such as schooling, and providing jobs to replant trees. Certify that no children <16 are involved with gold coming to world markets. Seek nonHg solutions to separating gold, including banning local sales of liquid Hg.

Discussion Local university medical/public health schools should sponsor studies of children who are now or were engaged in mining, examining injury rates, nervous system effects, effects of mine dusts-silica and lead, and times in water (in Philippines and Indonesia). These endeavours should also include studies of adult miners, examining the risks of silicosis/lung disease, autoimmune/kidney disease, and cancers based on industrial hygiene measures of silica and radiation. We need innovative means to remediate environmental damage

from gold mining. We need leadership in occupational health, education, exposure assessment/industrial hygiene to reduce the numbers of children in SSGM.

1216 WORKPLACE HEALTH RISKS MANAGEMENT IN DEVELOPING WEST AFRICA COUNTRIES, THE ROLE OF ACADEMIC HEALTH INSTITUTIONS

Hayford Etteh. *International Fund for Agricultural Development, United Nations, Accra, Ghana*

10.1136/oemed-2018-ICOHabstracts.685

Introduction This paper examines the major health threats and risks to employees in Ghana and some West African countries amidst the rapidly growing mining, metals, oil and gas industries. It looks at the role of key stakeholders, particularly academic health institutions in the evidenced-based management of occupational health to improve the health, productivity and performance of the working population.

Methods The paper was developed from extensive literature review and interview of some industry leaders to understand some historical trends of employee occupational health promotion and protection indices and the current situation of occupational health and hygiene standards in the sub-region.

Results Clearly, the present West African employee (local and expatriate) are heavily burdened with diverse kinds of health threats, both from the workplace and non-work-related sources. The threats and associated risks were noted to be hugely skewed towards infectious diseases and occupational health hazards origins. That notwithstanding, non-communicable diseases challenges, like mental health, hypertension, diabetes, cancers and musculoskeletal disorders had prominent place in the workplace health hazards and risks matrix.

Discussion Academic health institutions in West Africa, despite having major roles to play in defining and managing occupational health hazards, were noted not to be actively engaged. Training of competent professionals to run workplace wellness, occupational health and hygiene programs in high-risk workplaces in developing countries, research to have evidence based problem definitions and efficient alternative solution pathways with maximum health outcome are all some of the roles falling in the domain of academic health institutions. Legislation and occupational standards development cannot be achieved without credible research evidence support – this was noted to be a huge gap in the West-Africa sub-Region.

The way forward was identified as; key stakeholders working together using a systemic and systematic approach to progressively define and address workplace health problems to improve occupational health outcome.

I am currently and IFAD medical advisor and have been in this role for the past 7 months as consultant. Prior to assuming this position, I was a UN volunteer as a medical officer providing occupational health, primary health and emergency medical services to the UN staff deployed in North Korea. This I did for 18 months with no salary, but only basic allowance to support my basic living allowance. Before moving to North Korea, I served in a similar capacity for 10 years in Ghana, DR Congo and Lebanon with basic remuneration. I am optimistic that, this provided valuable services to contribute to the identified and shared gap (by ICOH and ILO) of far less than 10% of developing countries employees receiving occupational health services consistent with workplace risks
