but also contain guidance on the use of levers, crankcases and wheels that are fitted to work stations.

**Methods** This paper presents the results of several research studies performed by NIOM researchers in the field of force necessary for the professional activities. The studies were done using the measuring set: tensometric dynamometer, force converter, amplifier and PC for data collection. Measurements were done at least 3 times for one activity, the average value of force was taken for further analysis.

**Result** During the tests, it was stated that, depending on the technical condition of the transport trolleys used in the hypermarkets (weight including the load of about 450 kg limited by law), kind of the pavement on which they moved and the way they were put into motion, the force necessary to start their movement was from 60 n to 650 n.

**Discussion** These values were 2–3 times higher than the applicable standards (300 n – for pushing, 250 n – for pulling). On the other hand, the measurements of the force needed to launch overloaded trucks used in the transport of gas cylinders or materials in the textile industry (up to about 1500 kg) indicate the necessity to use 500 n – 700 n force – well above the permissible. It is visible that the ergonomic interventions including education and training is necessary.

**BIOMECHANICAL AND PHYSIOLOGICAL PARAMETERS FOR MANUAL MATERIAL HANDLING (MMH) RISK ASSESSMENT IN MARITIME WORKERS**

1A Silvetti*, 2E Munafò, 1A Ranavolo, 2F Draicchio. 1INAIL, Monte Porzio Catone, Italy; 2ITAL UIL, Rome, Italy

10.1136/oemed-2018-ICOHabstracts.769

**Introduction** According to EU data, the fishing sector is the one with the highest injury rate of all other sectors. Aim of the study is to assess some MMH tasks in which it was possible to use the common standardised protocols in conditions where, although their restrictions, they could provide early indications.

**Methods** NIOSH protocol was used to assess unloading crates of fish (weight of 12 Kg or 16 Kg) out of the boat to the van and while unloading crates, inside the boat, from the refrigerator to the slipway. Unloading crates from the boat to the van was studied also by means of 3DSSPP to estimate compression force at L4/L5 level. Heart rate monitors were used to estimate CCr while handling crates inside refrigerator.

**Result** Results obtained using the NIOSH protocol show LIs between 2.55 and 6.34 and a RWL between 2.52 Kg e 4.69 Kg. 3DSSPP analysis reported L4/L5 compression force ranging between 2752N and 3946N and low strength percent capability at wrist, shoulder, trunk and hip joints. Unloading crates from refrigerator to slipway analysis reported LIs ranging from 1.63 to 5.83 and a RWL ranging from 2.74 Kg to 7.36 Kg. MMH inside refrigerator showed CCr values of 40.5% and 42.7%.

**Discussion** During boarding, we observed several activities worthy of attention under the biomechanical overload point of view. We investigated the most strenuous tasks according to the crew’s information. All obtained values were largely over the limit for all used methods and are consistent with results from other studies. We observed MMH activities not assessable with any of the methods currently available in the literature because they cannot describe the tasks in their globality. It was also noted that the workers, based on their experience, have adopted enhancements reducing vertical displacement, asymmetry angle and adopting an internal organisation of rotation during MMH tasks.

**DOCKWORKERS MUSCULOSKELETAL INJURY PREVENTION PROGRAM ON A BRAZILIAN TERMINAL**

1EB Lima*, 1JM Almeida, 1AS Alves, 2MA Pinto, 2FF Santos. 1Occupational Physician in Terminal Exportador do Guarujá (TEG); 1In charge of Quality of Life (TEG); 2Work Nurse (TEG); 2QMS Supervisor (TEG); 2Operation Manager (TEG)

10.1136/oemed-2018-ICOHabstracts.770

**Introduction** Terminals in the port of Santos, the largest in Latin America, are constantly working to minimise physical impacts of work on employees. Aiming at the prevention of musculoskeletal injuries and quality of life improvement, we implemented a series of functional and ergonomic measures in 2014, which resulted in significant absenteeism reduction and excellent acceptance from employees, with a relevant improvement to their quality of life.

**Methods** The program begins with a health evaluation on the employee’s admission that includes anthropometry, dynamometry and surface electromyography. On the first month of work, the employee’s last 40 min of the workday are held in a gym inside the terminal, where specific exercises, conducted by 3 physical educators professionals. After this period this routine becomes optional, but with a strong incentive for its continuity (outside of the work period). Also, there is a daily labour gymnastics program maintained for all employees. Concomitantly, research is done on ergonomic conditions, where employees give opinions about job satisfaction and possible adverse conditions, suggesting actions that will be evaluated by the Ergonomics Committee that study and treat these cases.

**Result** Since 2015, when the program started, if compared to 2014, there was a 30% reduction of absenteeism caused by osteo-muscular injuries. From 2015 to 2016 there was a 46% absenteeism reduction from the same causes. When comparing 2014 with 2016, there was an overall reduction of 62%. Additionally, in 2016, 132 employees suggestions on ergonomic aspects were raised and addressed by the Ergonomics Committee. A relevant index show that 78% of the employees were practicing some physical activity by the end of 2016 and of those, 48% performed the activities inside the Terminal’s gym.

**Discussion** Musculoskeletal injuries are the major causes of dockworkers absenteeism. The Program implementation and employees suggestions significantly reduced absenteeism rates, encouraged the physical activities practice in the workplace and consequently improved their quality of life.

**A PRACTICAL NOVEL MODEL FOR OFFICE ERGONOMICS AWARENESS AMONGST GLOBAL CORPORATE OFFICE EMPLOYEES’ SHARING EXPERIENCE FROM 11 COUNTRIES**

Kishore Madhwani. Hindustan Unilever Limited, Mumbai, India

10.1136/oemed-2018-ICOHabstracts.771

**Introduction** With increase in use of laptops, globally there is a need to spread awareness on office ergonomics. The
challenge lies in educating maximum employees in shortest time thereby reducing musculoskeletal ailments and promoting safer working by exploring effective communication methods.

**Methodology** A cross-sectional study encompassing Unilever Global Corporate Office Employees' is being undertaken [2013–2017] in India, Dubai(U.A.E), Nairobi (Africa), Durban (South Africa) and South East Asian countries [Philippines, Vietnam, Indonesia, Singapore, Malaysia, Thailand and Sri Lanka] n=Total 2646.

Employees were grouped into two, to study following interventions;

- Lecture training including a forty-minute power point presentation & demonstration on a mock office workstation educating employees on maintaining ideal work postures, back & eye protection, taking rest breaks, performing desk stretches & arranging workstations ergonomically to their body dimensions'. n = 1546.
- Short demonstrations (ten minutes) on each office floor on a live workstation educating employees on same parameters'. n = 1100.

**Results** Forty minute Lecture training enhances awareness in >92% employees'. However, few employees attend this training, due to hectic work schedules.

Short ten minute live demonstrations undertaken in above countries appears to be an excellent tool enhancing awareness in >90% employees. When both above interventions were tested for statistical significance, 40 min lecture was superior only in Indonesia (p<0.05).

**Discussion** As few employees attend 40 min lecture training (though superior) on office ergonomics, the ten minute live demonstration is a promising practical novel intervention as it is comprehensive, undertaken at the workstation, enhancing awareness in maximum employees in a short-time, instilling a feeling of caring and bonding which is vital for a successful and robust office ergonomics control program. A reminder card with tips on chair adjustments, ergonomic arrangement of workstations and a link on desk stretches serves as handy desk-reminder emphasising safer working practices.

**485 THE TRENDS AND DETERMINANTS OF WORK-RELATED MUSCULOSKELETAL DISORDERS (MSD) IN IRELAND BETWEEN 2002 AND 2013**

Helen Russell*, Bertrand Maitre, Oona Kenny, Dorothy Watson, Economic and Social Research Institute, Dublin, Ireland

10.1136/oemed-2018-ICOHabstracts.773

**Introduction** In Ireland between 2002–2013, Musculoskeletal Disorders (MSD) accounted for 50% of self-reported work-related illnesses. Moreover the average number of days absent (15.9 days) was higher than the average of 12.8 days for all other illnesses (except stress, anxiety and depression).

**Methods** This paper examines trends and determinants for work-related MSD between 2002 and 2013, using annual cross-sectional data from the Quarterly National Household Survey (QNHS).

**Results** Rates of MSD were strongly linked to the economic cycle. Rates per 1000 workers ranged from 11 in 2002 to 19 during the economic boom before falling to 7 during the recession (2009). The 2013 rate in a recovering economy was 14 per 1000 workers.

This pro-cyclical pattern remained when characteristics of workers and their workplace were held constant using logistic regression. Furthermore, within sectors, rates were higher when the annual percentage change in employment was positive.

We also found that certain worker and workplace factors influenced the risk of MSD independently. Workers aged 35–64 had the highest risk of MSD (2.5 times more than workers <25 years). Construction sector workers, followed by those working in agriculture and health, had the greatest risk of MSD. Rates in education and all other services sectors were much lower. The self-employed, those working 40 to 49 hours per week (compared to <30 hours), shift workers, and new recruits (with <6 months job experience) also had a higher risk of MSD.
