A SYSTEMATIC REVIEW ON MEASUREMENT TECHNIQUES OF WORKERS’ EXPOSURE TO NANOMATERIALS IN LOW- AND MIDDLE- INCOME COUNTRIES

Fabio Boccuzzi*, Diana Gagliardi, Riccardo Ferrante, Bruna Maria Rondinone, Sergio Itavoli. INAIL – Department of Occupational and Environmental Medicine, Epidemiology and Hygiene

Introduction Nanotechnology expresses great potential as enabling technology but there are still uncertainties about the health risks for workers potentially exposed to nano-objects and their agglomerates and aggregates (NOAA). Different methodological approaches to measure airborne NOAA in the workplace have been proposed. This study finalised a systematic review on this theme with the aim to identify techniques of exposure measurement to be recommended even in contexts with low resources, such as Low- and Middle- Income (LMI) countries.

Materials and methods We collected scientific papers reporting techniques of NOAA exposure measurements in the workplace and we summarised the data for each eligible technique according to PRISMA guidelines; then we rated the quality of evidence following an adapted GRADE approach.

Results We found 69 eligible studies to be included in qualitative synthesis: the majority of studies reported a moderate quality and only 2 studies demonstrated the use of a high quality exposure measurement technique. The review demonstrates that a basic exposure measurement, i.e. evidence for the presence or absence of NOAA in the workplace air, can be achieved with moderate (40 techniques) to high quality (2 techniques); 13 of these techniques are defined as comprehensive, since they allow also the quantification of NOAA in the workplace.

Conclusions This systematic review allowed identifying criteria for a reliable measurement of exposure to NOAA to be recommended in LMI countries. The findings of the study defined a list of requirements that must be fulfilled by an effective measurement technique (either basic or comprehensive), and highlighted the main weaknesses that need to be tackled for an effective affordability evaluation.

WORKPLACE EXPOSURE PROBLEMS DETERMINED IN CLEANING PROFESSIONALS WORKING IN IZMIR, ANTLYA AND BURSA PUBLIC HEALTH DIRECTORIES

Serap Gökmen, 1Naile Erțürk, 2Yasemin Uşar, 2Dersiz İkrar Andal, 3Hikmet Arif Çınar, 3Federike Schaafsma, 4Mustafa Kemal Başaralı, 4Ahmet Özlü, 4Public Health Directorate of Izmir, Turkey; 6Public Health Directorate of Antalya, Turkey; 5Public Health Directorate of Bursa, Turkey; 59th September University umir Turkey; 6Dept. of Public and Occupational Health, VU University Medical Centre, Amsterdam Public Health research institute, Netherlands; 6Public Health Institution of Turkey

Introduction Physical, chemical and biological risk factors exist in workplaces of cleaning professionals. These risk factors at work may cause respiratory, skin, and musculoskeletal health problems for these workers. The prevalence of these health problems caused by occupational risk factors such as exposure to chemicals in cleaning products and physical strain in the workplace of cleaning professionals are not yet fully known in Turkey.

For this reason, the objective was to assess the extent of workplace exposure to occupational risk factors for cleaning professionals of izmir, Antalya and Bursa Public Health Directors (including subcontractors).

Methods We plan a cross sectional study using a questionnaire on socio-demographic characteristics, risk factors at work, work history, health history, health status, exposures,European Community Respiratory Health Survey II(ECHRS II) questionnaire, Nordic Occupational Skin Questionnaire and the Nordic Musculoskeletal Questionnaire using a face-to-face interview method. The interviews will be performed by trained occupational health and safety specialists from the Public Health Directorates of izmir, Antalya and Bursa Turkey.
