second year students. Qualitative data were analysed using the applied thematic analysis methodology.

**Result** Computer anxiety was significantly higher for first year students compared to second-year students (t=4.08, p<0.001). Lecturers also indicated barriers to using on-line technology for teaching.

**Discussion** Blended learning, a useful teaching strategy, has the potential to advance the OHN specialisation programme at DUT through the numerous opportunities for collaborative learning that the online technology affords. However, the challenges faced by both lecturers and students need to be addressed through focused interventions to ensure the optimal use of this teaching/learning strategy.

#### 1378 PERMANENT EDUCATION PRACTICE IN OCCUPACIONAL HEALTH: AN INTEGRATIVE REVIEW

Ellen Silva da Anunciação, Cristiane Helena Gallach*, Magda Guimarães de Araujo Faria, Eugenia Fuentes Pérez Júnior, Priscila Cristina da Silva Thengo, Luciana Valadão Alves Kaban, Rio de Janeiro State University, Rio de Janeiro, Brazil, Instituto Federal de Educação, Ciência e Tecnologia Fluminense, Rio de Janeiro, Brazil

**Introduction** Permanent education in health has not the aim of training health professionals, but proposes to bring them together the team to build knowledge, valuing the concept of teaching-learning through a new policy proposal to improve work processes.

**Objective** To analyse experiences and strategies of continuing education about workers’ health in scientific publications from the last ten years.

**Method** It is a literature integrative review, from 2006 to 2016, with search in Virtual Health Library and Scientific Electronic Library Online databases. All the six steps of methodology were developed: defining research question – What strategies and experiences of permanent education for workers’ health have been described in the literature?; determining search strategy, with Occupational health, Continuing education and Permanent education as descriptors; categorising studies; reading papers to determine those containing results; discussion of the results; and presentation of the integrative review.

**Results** Eight articles were selected and analysed. After applying all steps of integrative review, data was classified in two categories: Strategies of continuing education and Experiences of continuing education.

**Conclusion** There is a lack of scientific and technical knowledge about Strategies of continuing education, being an important cause of difficulty to develop the work process, which is often aimed to collective strategies and always seeking the transmission of knowledge. About Experiences of continuing education, it’s observed the development of guidelines directed to the ergonomic risks, with participation of workers.

#### 466 ANALYSIS OF HEART RATE VARIABILITY DURING THE INHALATION OF A DIFFUSED AROMA

Yuriko Hachiya*, Minoru Shibata, Hiroshi Inujima, School of Health Sciences Occupational and Community Health Nursing, University of Occupational and Environmental Health, Japan, Fukuoka, Japan; Department of Otolaryngology Head and Neck Surgery, School of Medicine, University of Occupational and Environmental Health, Japan, Fukuoka, Japan; Graduate School of Information, Production and Systems, Waseda University, Fukuoka, Japan

**Introduction** Stress-related disorders, such as depression, psychosomatic disorders and anxiety neurosis, are common and increasing in the workplace. Aromas have ataractic and sedative effects on the parasympathetic nerves. They also affect the feelings of fatigue from stress by stimulating the central nervous system. The purpose of this study is to examine the effect of an olfactory stimulus on changes in a physiological index. Using aromas during the loading of stress, we measured beat-to-beat interval (R-R interval) times from electrocardiogram (ECG) recordings.

**Methods** The subjects in our study were 3 male medical university students (subjects’ codes were A, B and C). After
assuming a relaxed seated position for 10 min, the subjects performed a mental arithmetic task for 60 min followed by relaxation for 30 min, and then a rest for 10 min. The mental arithmetic task is a method of adding numbers without using tools. Every subject performed both the control-load and aroma-load tests under the same protocol, while the ECG was measured. They smelled lavandula angustifolia during the aroma-load.

Result We analysed the power spectrum of high and low frequencies. The P1 (low frequency)/P2 (high frequency) was defined as the ratio of P1 to P2. There was no change in the P1/P2 of 2 out of 3 subjects by using the aroma. Subjects A and B could avoid mental stress by using the aroma during the mental arithmetic operation.

Discussion In an analysis of the power spectrum in the R-R interval times, the high and low frequencies in the physiological index of stress loading suggest that the aromas have an effect on the autonomic nervous system. As the strain on sympathetic nerve was relaxed, we conclude that the aroma affected the sympathetic nerves. Thus, we conclude that the aroma affected a sympathetic nerve, relaxing the strain on it.

Introduction Occupational health nurses can achieve high performance so that the competencies necessary for occupational health nursing practices are being acquired. The purpose of this study was to clarify how occupational health nurses are in possession of competencies required for occupational health nursing practices in Japan.

Methods An anonymous, self-administered questionnaire survey was conducted by mail. The questionnaires were distributed to 357 Japanese occupational health nurses and 211 were collected. (response rate, 56.3%). 21 of 211 were excluded because of incomplete responses and 190 were analysed. We asked the rate at which they possessed 40 competencies developed by Kono et al. All competencies were rated on a 7-point Likert scale (1=Never, 7=Always). Data were collected between September 2016 and January 2017. We calculated descriptive statistics for all variables. As for the comparison of competencies’ scores by years of experience as occupational health nurses, the Tukey HSD test was used. This study was approved by the ethical review board of Yokkaichi Nursing and Medical Care University.

Results The mean score of 8 competencies was more than 5.5 points. The mean score of 3 competencies was less than 4.5 points. All competencies’ scores differed significantly by years of experience as occupational health nurses.

Discussion The competencies with high scores were common to nurses who had awareness of themselves as professionals, valuing human relations with clients, and supporting clients with respect. Therefore, we considered that these were competencies that were easy to acquire for occupational health nurses who learned nursing science. We also considered that some competencies might be low because nurses were not able to access them without opportunities for experience and activity.
