training, suggesting that doctors learn best through applied ‘leadership learning’ as opposed to theory-driven programmes. **Conclusions** Drawing on Self-Determination Theory this study provides a theoretical framework for engaging doctors in Medical Leadership; assessing their leadership competency and learning needs and setting up reliable leadership training programmes. Doctors’ ability to reliably determine their learning needs and the invaluable role of hands-on leadership/management experience in boosting doctors’ leadership confidence, calls for more personalised and relevant learning plan that can build on their previous experience and expertise.

**1511** **WARNING BELL AGAINST THE RISE OF VIOLENCE WITH REGARD TO HEALTH PROFESSIONALS IN THE EMERGENCY DEPARTMENT**

M Lghabi*, W Alouche, B Benali, R Rhattas, A El Kholti. Casablanca Faculty of Medicine and Pharmacy, Hassan II University, Morocco

**10.1136/oemed-2018-ICOHabstracts.1060**

**Introduction** The violence is strongly present in the current hospital context, where the violence in the hospital is increasing, in particular with regard to harm to persons. The emergency department, as the hospital’s multidisciplinary gateway, is now the most widespread hospital service with the highest number of acts of violence.

**Methods** This is a cross-sectional study conducted with the emergency department staff at a prefectural hospital in Casablanca using a self-administered questionnaire. The aim is to evaluate the violence in the emergency department and to define the methods of prevention.

**Result** Only 30 people (37.5%) participated in the survey, with a female predominance (66.6%). The average age was 35 years. 90% of our respondents feel exposed to violence in the performance of their duties. Nurses are the most exposed occupational category (34.6%). Visitors and accompanying persons were the main perpetrators of the violence (66.6%). Violence occurs more at night (39%). 69% of violence is harmful to people. Only 33.3% of the violence was reported to the administration.

**Discussion** Several studies, including ours, show a female predominance, this could be explained by the feminization of health personnel. In our study, visitors or accompanying persons were the most responsible for the violence (66.6%), which is in line with several Moroccan studies. However, the 2014 annual report of the national observatory of violence in the health sector shows that in 72% of the perpetrators of the violence were patients. Personal injury is the most frequent, which is in accordance with the literature. On the other hand, the reporting rate remains relatively low compared to the literature.

**Conclusion** Violence against health personnel has become a daily reality. Its continuous rise has sounded the alarm calling to control this risk. Efforts should be pursued towards evaluation and prevention in order to optimise exercise safety.

**1665** **AVIATION MEDICINE: THE GLOBAL CHALLENGES TO REGULATORS AND AIRLINES**

Marcus GP Wong*, Durham University, Durham, UK

**10.1136/oemed-2018-ICOHabstracts.1062**

**Aim of special session** An overview about contemporary global challenges to aviation regulators and airlines

1. Dr Tom Gaffney, 2Dr Elizabeth Wilkinson

1. Irish Aviation Authority, Dublin, Republic of Ireland
2. British Airways Health Services, Harmondsworth, UK

Regulatory aviation medicine/avaiomedicine, a subsection of occupational medicine, aims to determine whether pilots are medically fit to fly either routinely or in response to a decrease in medical fitness. Traditionally, change occurs very slowly in aviation medicine, new treatments and technologies must be evidence based and well established before the standards will change. The role of the aviation medical regulator (“medical assessor”) has become more demanding in the past 20 years as many complex ongoing clinical conditions have now been deemed compatible with safe flight. Therefore, many pilots are now deemed fit to fly where formerly their careers would have ended. In addition, regulators (competent authorities) around the world determine the medical standard.
