Introduction Alvin Toffler first used the term ‘information overload’ in his 1970 published book ‘Future Shock’. Nearly 50 years later, facing work without spatial or temporal boundaries, this concept becomes reality. We conducted a systematic review on the determinants of information overload and on its consequences on health, quality of life, performance and quality of work.

Methods We searched EBSCOhost (Academic Search Complete + Business Source Complete + PsycARTICLES + PsycINFO + PsycYDX), PubMed, and Web of Science (until March 2017) using a sensitive search string. Two independent reviewers screened the titles and abstracts for eligible articles and a third reviewer negotiated consensus. Further assessments of eligibility and quality assessment (of quantitative studies only) were conducted in a similar manner. The search resulted in 2535 records. The data of 33 full-text articles representing 16 quantitative and 18 qualitative studies were included and extracted. All quantitative studies were judged as of poor methodological quality: most studies applied a cross-sectional design and reported only univariate correlation coefficients. Due to the high heterogeneity of the studies, a meta-analysis could not be conducted.

Results The results of our systematic review point to a relationship between high information amount and perceived information overload. According to the included studies, information overload was positively associated with work time spent with Emails, work-to-family conflicts and negatively associated – inter alia – with technical support, segmentation between work and family life, and appropriate Email management techniques.

Discussion The most striking result was a clear lack of methodically sound studies on the determinants and consequences of information overload. Future studies on this important topic should provide a defined study base, should take the temporal sequence into account and should quantify information amount.

HEALTH AND BEHAVIOURAL OUTCOMES ASSOCIATED WITH STRESS IN MALAYSIAN POLICE OFFICERS

1,2Masilamani Retneswar*, 1Awang Bulqia, 1Karuthan Chirra, 2Azlan Darus, 1Kandiben Shathanapriya, 3David Koh. 1University of Malaya, Kuala Lumpur, Malaysia; 2UCSI University, Marang, Malaysia; 3Universiti Brunei Darussalam, Gadang, Brunei Darussalam; 4National University of Singapore, Singapore

Introduction Police officers are vulnerable to the stress provoking environment resulting in chronic police stress over time, with increasing susceptibility to diseases. Eventually, on-going stressors will drain energy and enthusiasm taking a toll on the worker’s physical, mental (psychological) and behavioural health lifestyle. The objective was to study the health and behavioural outcomes associated with stress among police officers in a Metropolitan Federal Territory of Malaysia – Kuala Lumpur.

Methods A cross-sectional study was conducted in two randomly selected police districts in Kuala Lumpur from 2012–2015. A total of 579 police officers from 2 headquarters and 11 police stations participated in this study. The 21-item Depression, Anxiety and Stress questionnaire was used. Multinomial logistic regression analyses were carried out.

Result The study reported that 40.3% police officers (95% CI: 55.0 to 64.3) had some level of stress; 6.4% (95% CI: 4.4 to 9.2) severe, 15.1% (95% CI: 11.9 to 19.0) moderate and 18.8% (95% CI: 15.3 to 22.8) mild. A police officer who reported mental illness had 6 times the odds of being severely stressed (aOR 5.83, 95% CI: 1.82 to 18.61) compared to one not mentally sick while a police officer who reported headache had nearly 3 times the odds of experiencing severe stress (aOR 2.91; 95% CI: 1.09 to 7.75) compared to one who reported no headache. A police officer who did not exercise or pray had 3.8 times odds (aOR 3.79, 95% CI: 1.65 to 8.75) and more than 5 times odds (aOR 5.15 (1.58,16.85) of being severely stressed compared to an officer who exercised or prayed respectively.

Discussion Headache and mental illness were positively associated with police stress levels. Higher prevalence of stress justifies instituting peer counselling and stress reduction strategies while annual medical screening must be made compulsory for early detection of those with common diseases (hypertension and diabetes), frequent headache and mental diseases.

STRESS AMONG CENTRAL INDUSTRIAL SECURITY FORCE PERSONNEL - A COMPREHENSIVE ASSESSMENT AND ACTION PLAN

1GV Prabhu*, 2Madhura Joshi, 3Udaya Kumar Reddy. 1Advisor (Medical and OHSE), Goa Shipyard Limited, Vasco da gama, Goa; 2Honorary Director and Psychosocial Consultant, REACH, Panaji, Goa, India; 3President, International Stress Management Association, Hyderabad, India

10.1136/oemed-2018-ICOHabstracts.1639

Introduction Central Industrial Security Force (CISF) protects critical installations in the country. Though this para-military force were given requisite training to handle stressful jobs but in drawing upon recent incidents and some of the empirical studies in CISF, a wide range of issues including factors intrinsic to the job, organisation culture, and managerial style, style of work in organisation and home/work interface create unmanageable stress and impact on personnel psychological health and overall well-being. In CISF, there are well-defined practices and procedures that govern the way an employee should conduct but it depends on how effectively these polices and practices are implemented in the organisation.

Methods Investigator used Stress Audit Scale adapted from Udaya Kumar Reddy (2005) to assess the perceived distress, personality traits, and all connected stressful demands was used. The present study was undertaken on a total of 326 CISF Personnel in three major work location of Goa (i.e. Airport, Shipyard and Port Trust). Sub officers (i.e. Inspectors, Sub-inspectors, Asst. Sub Inspectors) and Constables participated in the study. Stress awareness session was delivered before administering the questionnaire. Focused group discussions conducted for capturing qualitative data.

Result Most of the CISF Personnel were under high overall distress across the cadre in all three units. Personality traits are significantly correlated with distress. Subjects’ Distress was significantly correlated to their Role Stress variables and...
Psychosocial Safety Climate. Some specific organisational variables emerged has the significant impact on perceived distress.

**Discussion** CISF Personnel requires a comprehensive Stress Assessment that helps to focus on required behavioural competencies to improve upon and also will enable effective implementation and continual improvement of the policies and practices. It necessitates stress safety net which will in turn provide necessary stress management programmes, counselling services and staff welfare planning to promote employee work-life balance and organisational excellence.

**Introduction** Corporate governance, through the involvement of employees and the dynamics that it can produce, is an essential issue for efficiency and for safeguarding workers’ health. Many studies have shown that individual autonomy is a determining factor for occupational health. Employees must have individual and collective leeway in organising their work, not only applying procedures that have been defined by others but being able to show their creativity and influence their work environment. In this aim, organisational design should provide the opportunity to influence management modes, distribution of power, individual participation in the design processes. The concept of subsidiarity can help to achieve these goals.

**Methods** From an ergonomic intervention in an insurance company about the organisation of a call centre, we can see what are the conditions to build an organisation aiming at subsidiarity, both as a target and as a process for the management of change.

**Results** Contrary to the idea of a predetermined definition of all the decisions that can be taken at every level of the hierarchy, efficiency consists in constantly adapting the levels of decision-making to the problem being dealt with. This requires constructing an organisation which is sensitive to details of events, which can be always adjusting the levels at which matters are dealt with. However, this swing from one decision level to another is only possible if the organisation and the people within it are well prepared beforehand.

**Conclusion** The concept of subsidiarity constitutes an ethical point of reference for dealing with questions of organisational design and corporate governance. It favours decision-making at the lowest appropriate level by following three organising principles: the competency principle, the assistance principle, and the substitution principle. The way we build the interventions must be in line with this vision. It is both a matter of efficiency and a dynamic for healthy organisations.

**Introduction** Mobile phones have affected how we communicate, interact, search for information, and pass time, at work and at leisure, implying a near ubiquitous use. There is a growing literature on potential health effects of mobile phone use. The aim was to review epidemiological studies considering electromagnetic fields, attention while driving/safety. It necessitates stress safety net which will in turn provide necessary stress management programmes, counselling services and staff welfare planning to promote employee work-life balance and organisational excellence.

**Introduction** A review was undertaken of a comprehensive stress assessment that helps to focus on required behavioural competencies to improve upon and also will enable effective implementation and continual improvement of the policies and practices. It necessitates stress safety net which will in turn provide necessary stress management programmes, counselling services and staff welfare planning to promote employee work-life balance and organisational excellence.

**Discussion** The result of the design and its acceptance by the employees show that the process is as important as the goal. We can attest that several conditions must be controlled: which structure of the project, who to be involved, how, for what regarding their professional position, with which knowledge of the real work situations?

**Conclusion** The way we build the interventions must be in line with our vision of the future operation and the place of the users in the organisations. The project structure must ensure two goals: the involvement of the relevant managers and the participation of the employees concerned by the implementation, but with tools and a methodology. It is both a matter of efficiency and a dynamic for healthy organisations.

**Introduction** Psychosocial Safety Climate. Some specific organisational variables emerged has the significant impact on perceived distress.

**Discussion** CISF Personnel requires a comprehensive Stress Assessment that helps to focus on required behavioural competencies to improve upon and also will enable effective implementation and continual improvement of the policies and practices. It necessitates stress safety net which will in turn provide necessary stress management programmes, counselling services and staff welfare planning to promote employee work-life balance and organisational excellence.
