ICD 10 code	**Diseases**
J60-J65.0, J92.0	Pneumoconiosis
J60-J60.0	Coal workers' pneumoconiosis
J61-J61.0, J92.0	Asbestosis
J61.0	Pneumoconiosis due to asbestos and other mineral fibres
J92.0	Pleural plaque with asbestosis
J62	Silicosis
J62.0	Pneumoconiosis due to talc dust
J62.8	Pneumoconiosis due to other dust containing silica
J63-J65.0	Other pneumoconiosis
J63.0	Aluminosis
J63.1	Bauxite fibrosis
J63.2	Berylliosis
J63.3	Graphite fibrosis
J63.4	Siderosis
J63.5	Stannosis
J63.8	Pneumoconiosis due to other specified inorganic dusts
J64.0	Unspecified pneumoconiosis
J65.0	Pneumoconiosis associated with tuberculosis

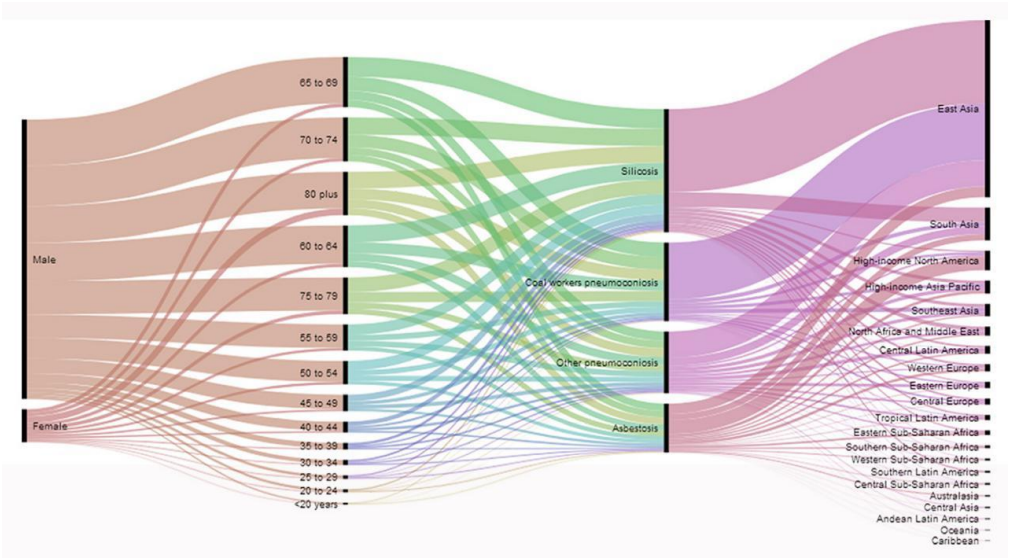
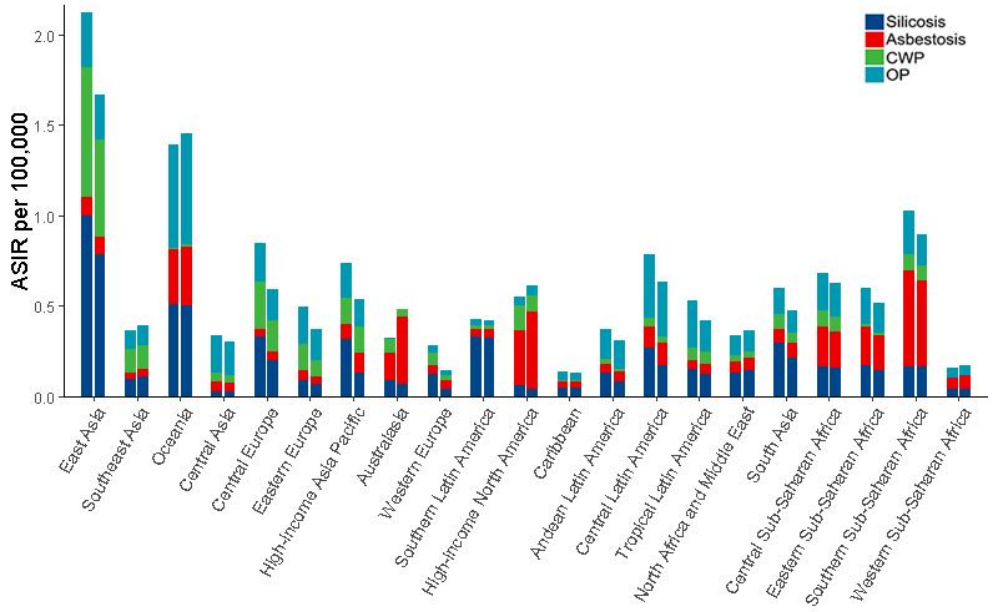
Supplementary Figure 1 Dendrograms.

Dendrograms were used to represent distributions of five SDI regions including for low, low-middle, middle, high-middle, and high and SDI. Each node indicates 195 countries and territories. SDI, socio-demographic index.



Supplementary Figure 2 Alluvial diagram of age and sex distributions of incident cases of pneumoconiosis by 21 GBD world regions attributed to different causes in 2017.

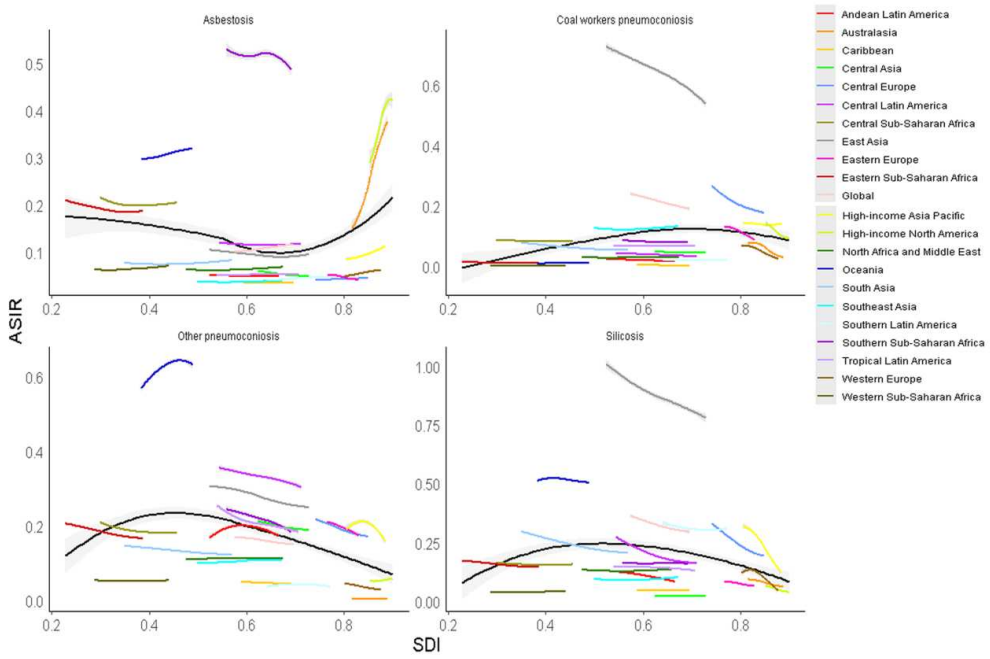
We used each node group as a dimension, the width of each node indicates the incident cases of pneumoconiosis, and results were sorted according to the incident cases of pneumoconiosis. GBD, Global Burden of Disease.



Supplementary Figure 3 ASIR of pneumoconiosis at a regional level.

The left column in each group is ASIR in 1990 and the right column is for 2017.

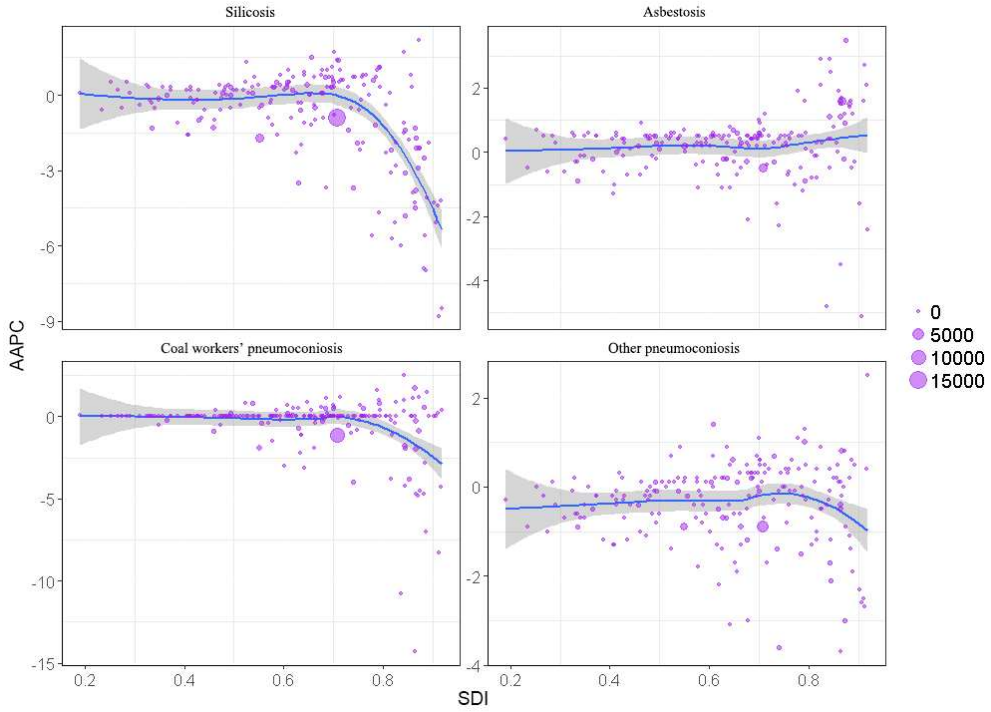
ASIR, age standardized incidence rate; CWP, coal workers' pneumoconiosis; OP, other pneumoconiosis; SDI, socio-demographic index.



Supplementary Figure 4 ASIR due to pneumoconiosis of specific etiology at a global scale for 21 geographical regions and the expected values based upon the SDI from 1990 to 2017.

The black line represents the expected value of an incidence rate based upon a LOESS regression for all years of available estimates by GBD locations and their SDI value. ASIR, age standardized incidence rate; GBD, global burden of disease; SDI, socio-demographic index; LOESS, locally weighted regression and smoothing scatterplots.

Further evaluation of measures of the relationship between ASIR and SDI in different categories of pneumoconiosis indicated that East Asia, Oceania, Southern Latin America, Central Europe, and high-income Asia Pacific had higher ASIRs due to silicosis than was expected based upon their SDI. Southern sub-Saharan Africa, high-income North America, Australasia, Oceania, Central sub-Saharan Africa, and Eastern sub-Saharan Africa had higher ASIRs due to asbestosis than was expected based upon their SDI. East Asia and Central Europe had higher ASIRs due to coal workers' pneumoconiosis than was expected based upon their SDI. Oceania, Central Latin America, East Asia, Central Europe, Eastern Europe, and high-income Asia Pacific had higher ASIRs due to other types of pneumoconiosis than was expected based upon measures of their SDI.



Supplementary Figure 5 The correlation between AAPC and SDI in 2017, by specific etiology. Circles represent countries that were available within the GBD data set.

The relative sizes of circles increase with an increasing number of pneumoconiosis cases caused by specific etiology in 2017. The blue line represents the expected value of AAPC based on a LOESS regression of all years of estimates by SDI value in 2017. AAPC,average annual percentage change; GBD, global burden of disease; SDI, socio-demographic index; LOESS, locally weighted regression and smoothing scatterplots.

Similar relationships were observed when we further evaluated measures of association between AAPCs and SDIs in silicosis, coal workers' pneumoconiosis, and other pneumoconiosis, whereas the association between AAPCs and SDIs in asbestosis was not found to have been statistically significant.

Supplementary Table 1 The incident cases and age-standardized incidence rate of pneumoconiosis in 1990 and 2017, and its temporal trends from 1990 to 2017 in 5 SDI regions and 21 geographical regions.
