

Supplemental material

E-Table 1 Causative agents and high-exposure work tasks of patients with irritant-induced occupational asthma.

Causative agent	Acute N=30 number, work tasks/exposure event	Subacute N=39 number, work tasks/exposure event	Total
Acids	6 <u>Sulfuric acid:</u> -leak, overwarming and evaporation of battery fluid into truck cabin (truck driver) <u>Sulfuric acid, hydrofluoric acid and nitric acid</u> -equipment failure causing dissolution of aluminum plates in an electrolysis bath, overheating of bath and evaporation of large volumes of acids (metal worker) <u>Hydrochlorid acid</u> -rescue task in chemical accident (ambulance worker) <u>Hydrochlorid acid and sulfur dioxide</u> -process leak in chemical plant (maintenance worker) <u>Hydrofluoric acid and nitric acid</u> -working above an open hydrofluoric and nitric acid container and cleaning acid dust (crane mechanic) <u>Hydrofluoric acid and hydrochloric acid</u> -welding of leaking refrigerator unit pipes containing tetrahydrofluoroethane (refrigerating machine mechanic)	7 <u>Sulfuric acid and ammonium fluoride</u> -washing concrete wall elements using spray detergent (concrete element worker) <u>Sulfuric acid and hydrogen sulfide</u> -working in metal production plant (machine operator) <u>Sulfuric acid, sulfur dioxide and sulfur trioxide</u> -working in chemical plant with many process failures (machine operator) <u>Hydrochlorid acid</u> -washing concrete elements using pressure washer and acid detergent (concrete element worker) -working in hot-zinc coating plant using acid baths for pre-purification, poor ventilation (metal worker) <u>Nitric acid fumes</u> -disturbances in air-conditioning in electroplating process with electrolysis bath containing nitric acid (2 metal workers)	13
Bases	5 <u>Ammonia</u> -other workers cleaning ammonia tank nearby (electrician) - emission of sludge heap in oil refinery (industrial cleaner) -performing work hygiene measures in a poultry rearing house (occupational hygienist) <u>Sodium hydroxide</u> -other worker poured sodium hydroxide powder into motor washer whose exhaust line led to patient's breathing zone (aircraft engine mechanics) <u>Black lye (in pulp cooking)</u> - sodium hydroxide-containing black lye pipe leak in pulp mill (scaffold mechanic)	4 <u>Ammonia</u> -packing broiler meat, leak in cooling system (food worker) -working in cowshed, cleaning sludge lines and basin (farmer) <u>Sodium hydroxide</u> -repairing output pipe of sodium hydroxide tank in pulp mill, two separate incidents (welder) <u>Mixture of alkaline epoxy polyamine hardener and cleaning agent</u> -tiling large indoor swimming pool area with poor ventilation (construction worker)	9

Mixtures of acids and bases		3 <u>Ammonia, sulfuric acid, hydrochlorid acid, hydrofluoric acid and nitric acid etc.</u> - working in electroplating process with poor ventilation (metal worker) -working in fertilizer plant (industrial cleaner) <u>Sodium hydroxide, potassium hydroxide, sulfuric acid, nitric acid, etc.</u> -mixing industrial detergents in small workshop (engineer)	3
Inorganic gases	3 <u>Chlorine dioxide</u> - chlorine dioxide bleach leak in pulp mill (3 mechanics)	3 <u>Chlorine dioxide</u> - chlorine dioxide bleach leak in pulp mill (mechanic) <u>Chlorine dioxide and hydrogen sulfide</u> -repeated leaks in pulp mill (operator) <u>Sulfur dioxide</u> -testing processes of different copper and nickel smelters abroad (engineer)	6
Oxidizing agents	1 <u>Ozone</u> -working in private apartment with ongoing air ozonation (electrician)	1 <u>Hydrogen peroxide</u> -working in pudding factory with poor ventilation and where hydrogen peroxide was excessively used for disinfecting lines (food machine operator)	2
Other chemicals	5 <u>Formaldehyde</u> -when cleaning, 4 liters of 38% formaldehyde solution spilled from broken fish specimen bowl (school cleaner) <u>Glutaraldehyde</u> - disinfection of piggery with poor ventilation (farmer) <u>Hexamethylene diisocyanate</u> -fire from polyurethane insulation material (construction worker) <u>Naphthalene compounds</u> -washing and mangling sheets which were handled with naphthalene compounds (launderer) <u>Pyrethrin</u> -cleaning after bedbug control treatment without pre-ventilation (cleaner)	1 <u>Hexamethylene diisocyanate</u> -spray painting with malfunctioning respiratory protective device (painter)	6

Mixtures	<p>6</p> <p><u>Sodium hydroxide, sodium hypochlorite</u> -washing warm garage floor with alkaline cleaning agent with poor ventilation (car mechanic)</p> <p><u>Sulfuric acid, sodium hypochlorite, chlorine gas</u> -mixing swimming pool chemicals incorrectly leading to generation of toxic fumes (caretaker at sports center)</p> <p><u>Combustion gas</u> -rescue task in burning building (police officer)</p> <p><u>Nitric oxides, diesel exhaust, mixture of oil and water</u> -performing work hygiene measurements in tunnel work (occupational hygienist)</p> <p><u>Bitumen, solvents and their thermal degradation products</u> -doing bitumen insulation indoors with poor ventilation (insulation worker)</p> <p><u>Thermal degradation of polyester powder paint</u> -due to inoperative washer, metal parts were overheated before powder painting (painter)</p>	<p>12</p> <p><u>Ammonia and hydrogen sulfide</u> -emptying sludge in piggery (farmer)</p> <p><u>Ammonia, hydrogen sulfide and endotoxins</u> - working in piggery (farm worker)</p> <p>-veneer log processing with chemicals to soften them (wheel loader)</p> <p><u>Hydrogen sulfide, sulfur compounds, sodium hydroxide, chlorine dioxide</u> -process failure in pulp mill (field worker)</p> <p><u>Calcium oxide and hydrogen sulfide</u> -Working in mine e.g. in calcium oxide storage and in metal sedimentation (machinery mechanic)</p> <p><u>Trifluoroacetic acid and acetonitrile</u> -keeping cleaning agents in open bowls (research assistant)</p> <p><u>Formic acid, acetic acid, formaldehyde</u> -working inside furnaces where wood was thermally modified (machinery mechanic)</p> <p><u>Solvents and mining dust</u> -washing mining vehicles with solvents and pressured air (machinery repairer)</p> <p><u>Rubber chemicals and their thermal degradation products</u> - weekly occurring fires from rubber material in production of rubber insulation (production worker)</p> <p><u>Thermal degradation of polyvinyl chloride (PVC)-coated fabrics</u> -heat-seaming plastic-coated canvas with electric charge at 175 °C, poor ventilation (seamstress, foreman and manufacturing worker)</p>	18
Dusts	<p>4</p> <p><u>Calcium oxide</u> -emptying sacks of calcium oxide powder (stevedore)</p> <p><u>Calcium oxide</u> -cleaning tank of calcium oxide powder with malfunctioning respiratory protective device (lorry driver)</p> <p><u>Cement</u> -spraying of concrete coating in tunnel, poor ventilation (tunnel worker)</p> <p>-cement silo breakdown during loading (lorry driver)</p>	<p>4</p> <p><u>Calcium oxide and alkaline dusts</u> - sulfur removal of exhaust gases by calcium sludge (power plant operator)</p> <p><u>Cement</u> -emptying sacks of cement (concrete layer)</p> <p><u>Ash</u> -transporting alkaline ash in a power plant, 5 accidental exposures connected to silo brake-downs (packer)</p> <p><u>Sulfuric acid-coated titanium oxide powder</u> -working in chemical plant (packer)</p>	8

Endotoxins	0	4 -washing dough sludge and contaminated insulation in bioethanol plant (driver of industrial sweeper) - transmitting malt in silo (worker in foodstuff company) - washing process of potatoes in potato flour plant (operator) - work in power plant using sod and woodchips (operator)	4
------------	---	--	---

E-Table 2 Agents causing irritant asthma: identification details, occupational exposure limits and relevant (irritancy-related) hazard classifications according to current EU legislation.

Chemical name	Chemical formula	CAS number	OEL for 8 hours, (ppm if not marked otherwise)	OEL for 15 min (ppm if not marked otherwise)	Classification according to CLP
Acids					
Sulfuric acid	H ₂ SO ₄	7664-93-9	0.05 mg/m ³	0.1 mg/m ³	Skin Corr 1A
Sulfurous acid	H ₂ SO ₃	7782-99-2	NA	NA	Skin Corr 1B
Hydrochloric acid	HCl	7647-01-0	NA	5 (7.6 mg/m ³)	Skin Corr 1A
Nitric acid	HNO ₃	7697-37-2	0.5 (1.3 mg/m ³)	1 (2.6 mg/m ³)	Skin Corr 1A Ox. Liq. 2
Hydrofluoric acid	HF	7664-39-3	1.8 (1.5 mg/m ³)	3 (2.5 mg/m ³)	Skin Corr 1A
Formic acid	HCOOH	64-18-6	3 (5 mg/m ³)	10 (19 mg/m ³)	Skin Corr 1A
Acetic acid	CH ₃ COOH	64-19-7	5 (13 mg/m ³)	10 (25 mg/m ³)	Skin Corr 1A
Trifluoroacetic acid	CF ₃ COOH	76-05-1	NA	NA	Skin Corr 1A
Bases					
Ammonia	NH ₃	1336-21-6	20 (14 mg/m ³)	50 (36 mg/m ³)	Skin Corr 1B
Sodium hydroxide	NaOH	1310-73-2	NA	2 mg/m ³	Skin Corr 1A
Potassium hydroxide	KOH	1310-58-3	NA	2 mg/m ³	Skin Corr 1A
Irritant gases					
Sulfur dioxide	SO ₂	7446-09-5	0.5 (1.3 mg/m ³)	1 (2.7 mg/m ³)	Skin Corr 1B
Chlorine	Cl ₂	7782-50-5	NA	0.5 (1.5 mg)	Ox. Gas 1 Skin Irrit 2
Chlorine dioxide	ClO ₂	10049-04-4	0.1 (0.28 mg/m ³)	0.3 (0.84 mg/m ³)	Ox. Gas 1 Skin Corr 1B
Hydrogen sulfide	H ₂ S	7783-06-4	5 (7 mg/m ³)	10 (14 mg/m ³)	Acute Tox 2 ^a
Nitrogen oxides	NO _x (e.g. NO, NO ₂)	NO: 10102-43-9 NO ₂ :10102-44-0	10 (12.5 mg/m ³) 1 (1.9 mg/m ³)	NO: NA NO ₂ : 2 (mg/m ³)	NO: Skin Corr 1B ^b NO ₂ : Ox. Gas 1, Skin Corr 1B
Other					
Hydrogen peroxide	H ₂ O ₂	7722-84-1	1 (1.4 mg/m ³)	3 (4.2 mg/m ³)	Ox. Liq 1 Skin Corr 1A
Ozone	O ₃	10028-15-6	0.05 (0.1 mg/m ³)	0.2 (0.4 mg/m ³)	Ox. Gas 1 ^b Skin Corr 1B ^b
Isocyanates	-NCO ^c	various	NA	0.035 mg/m ^{3c}	Skin Corr 1C ^b
Formaldehyde	HCHO	50-00-0	0.3 (0.37 mg/m ³)	1 (1.2 mg/m ³)	Skin Corr 1B
Glutaraldehyde	C ₃ H ₆ (CHO) ₂	111-30-8		0.1 (0.42 mg/m ³)	Skin Corr 1B (Resp Sens 1)
Sodium hypochlorite	NaClO	7681-52-9	NA	NA	Skin Corr 1B

Ammonium Fluoride	NH ₄ F	12125-01-8	NA	NA	Skin Corr 1C ^b
Inorganic dust	can be any, and be a mixture	can be any, and be a mixture	10 mg/m ³	NA	hazard evaluation must be based on the composition of the dust
Endotoxins	-	-	90 EU/m ³ ^d	NA	-

OEL= Finnish occupational exposure limit, NA=not available, CLP= The Classification, Labelling and Packaging Regulation (EC No 1272/2008)

^a E.g. systemic and neurological effects, locally pulmonary edema

^b Unharmonized classification

^c Isocyanate (-NCO) groups of any isocyanate compounds

^d Dutch OEL

E-Table 3. Workplace measurements in cases where available and relevant for assessment of exposure to irritant factors, and remarks on exposure. Some measurements were conducted by a trained occupational hygienist and some by respective company's own follow-up.

Workplace or process	Specific work process with high level of exposure	Substance measured	Mean air concentration in ppm, if not given otherwise (% of 8h-OEL) ^a	Maximum air concentration in ppm, if not given otherwise (% of 8h-OEL) ^a	Remarks
Piggery I	Sludge handling, piglet department and open shed	Ammonia (NH ₃)	6.6 (33)	37 (187)	Direct-reading device; generally poor workplace hygiene and ventilation; measurements taken after cleaning and additional ventilation, which possibly underestimates real situation
		Hydrogen sulfide (H ₂ S)	NA	4 (80)	
		Endotoxins	9500 EU/m ³ (10500)	NA	
Piggery II	Farrowing department, sludge handling and open shed	Ammonia (NH ₃)	1.1–16 mg/m ³ (9–114)	NA	Poor ventilation in several departments
		Hydrogen sulfide (H ₂ S)	>2.5 (50)	14 (280)	
Cowshed	Cleaning and emptying sludge pipe and basin	Ammonia (NH ₃)	10–20 (50–100)	214 (>1000)	Direct-reading device; high levels of ammonia also in everyday animal care
		Hydrogen sulfide (H ₂ S)	5 (100)	20 (400)	
Poultry rearing house	Inspection and occupational hygiene measurement	Ammonia (NH ₃)	60–80 (300–400)	NA	Direct-reading device measurement over one-hour inspection visit
Meat packing	Packing chicken meat and cleaning packing line	Ammonia (NH ₃)	10–150 (50–750)	260 (1300)	Online gas detector at workplace; high concentrations detected during 2 months with problems in cleaning system, including two larger ammonia leaks with especially high exposure
pudding production	Long-lasting and repeated high	Hydrogen peroxide (H ₂ O ₂) ^b	1.1 (110)	4.4 (440)	Online gas detector at workplace;

	exposure in normal work				several workers had experienced respiratory irritation; bleaching of hair and eyebrows was observed
Potato flour factory	Washing potatoes	Endotoxins	1900 EU/m ³ (2100)	NA	Occasional exposure also to alkaline washing agents
Foodstuff production	Handling malt	Endotoxins	25 000 EU/m ³ (28 000)	NA	Extremely dusty work handling malt of several different grains
Electroplating	High exposure to acid fumes and nickel especially during night shifts when air conditioning switched off	Nickel in air (Ni)	0.095 mg/m ³ (950)	NA	Two cases working in same shift; biomonitoring of nickel in one revealed high exposure 1–2 days previously, which was used as marker of exposure to all air impurities; the main cause of asthma in both cases was considered to be acid fumes that were visible especially in the night shift; airborne nickel was measured months later during a day shift with ventilation on.
		Nickel in urine (biomonitoring)	U-Ni 2.2 mmol/l (170)	NA	
Hot-zinc coating plant	Work near acid baths and hot zinc-coating fumes	Hydrochloric acid (HCl)	0.78–6.4 mg/m ³ (10–84) ^c	NA	Mean HCl levels that represent exposure over a working day were near the short-term OEL, thus exposure was excessive
		Formaldehyde (CH ₂ O)	0.324 (108)	NA	
Metal production plant	Working nearby wet precipitation processes utilizing hydrogen sulfide	Hydrogen sulfide (H ₂ S) ^b	repeatedly >10 (200)	NA	Hydrogen sulfide was monitored by online gas detectors at the workplace; the main causes of asthma were considered to be hydrogen sulfide and sulfuric acid evaporating from process lines; acids were not measured
Copper and nickel smelters (abroad)	Maintenance campaigns in several old-fashioned copper and nickel smelters abroad	Sulfur dioxide (SO ₂) ^b	NA	40–120 (800–2400)	Online gas detector at workplace; generally poor workplace hygiene in many places; sulfur dioxide the main emission in copper smelters

Metal mine	Working above precipitation tank where H ₂ S gas was bubbled through metal solutions	Hydrogen sulfide (H ₂ S) ^b	NA	weekly >20 (>400)	Online gas detector alarms were set to 20 ppm H ₂ S which is 4 x OEL; irritant and toxic H ₂ S gas and alkaline CaO powder (dust) were thought to be the main causes of asthma
	Loading calcium oxide (CaO) powder	Dust (alkaline)	>30 mg/m ³ (>300)	NA	
Chemical plant	Process work at different stages of sulfuric acid production	Sulfur dioxide (SO ₂)	0.6–2.98 mg/m ³ (46–230)	1.5–13.4 mg/m ³ (115–1040)	Direct-reading device; Gas leaks increasingly detected due to corroded process lines; sulfuric acid and hydrogen sulfide followed by online gas detectors but measurement data not available
Fertilizer plant	Cleaning process blockages with high-pressure-cleaner and chipping hammer	Hydrofluoric acid (HF)	0.45–8.7 mg/m ³ (30–580)	NA	Several corrosive agents (acids, bases, hydrogen sulfide and oxides); occasional very high exposure peaks exceeding capacity of online gas detectors at workplace. Exposed despite relevant respiratory protective equipment.
		Phosphoric acid (H ₃ PO ₄)	0.14–0.51 mg/m ³ (14–51)	NA	
		Sulfuric acid (H ₂ SO ₄)	0.034–0.068 mg/m ³ (68–136)	NA	
Chemical plant	Packing titanium dioxide (TiO ₂) powder coated with sulfuric acid (H ₂ SO ₄)	Dust (acidic)	16.9 mg/m ³ (169)	71.8 mg/m ³ (718)	Heavy exposure to dust; one of the main products was coated with H ₂ SO ₄ , which was the main reason for asthma; also nasal and eye irritation, chronic rhinosinusitis and nasolacrimal duct stenosis due to acidic dust
Bioethanol plant	3-day-period cleaning large area of biomass and contaminated insulation	Endotoxins	0.26–340 EU/m ³	NA	Measurements taken in normal situation and thought to underestimate the exposure during discharging and cleaning period
Pulp mill I	Handling process disturbances in pulp	Hydrogen sulfide (H ₂ S) ^b	daily >5 (>100)	NA	Online gas detectors at workplace

	digester and bleaching unit	Chlorodioxide (ClO ₂) ^b	daily >0.1 (>100)	0.93 (930)	
Pulp mill I, outside	Handling wood chip raw material outside and in storage tunnel	Hydrogen sulfide (H ₂ S) ^b	7 (140)	NA	Two high exposure occasions: first outside plant when cloud of H ₂ S and ClO ₂ from the process reached the patients' working area, another was a week later when working in a storage tunnel with high levels of H ₂ S, as detected by personal online gas detector
Pulp mill II	Process leak of ClO ₂ solution into open channel on floor	Chlorodioxide (ClO ₂) ^b	0.69 (690)	NA	Personal online gas detector; one occasion of high exposure
Power plant I	Accidents such as collapse of 150–300-ton silo when loading ash	Dust (alkaline)	3.4 mg/m ³ (34)	NA	Alkaline ash dust considered to be main reason for asthma; dust measurements taken in normal work but accidents represent very high exposure levels; 5–6 accidents/five years' employment
Power plant II	Opening wood chip tanks in connection with process disturbances	Endotoxins	1500 EU/m ³ (1700)	NA	Repeated high-level exposure to endotoxins over several years
Tunnel construction	Concentration of diesel exhaust from tunnel cleaning machine due to ventilation being switched off	Nitrogen oxides (NO _x) ^b	>100 (400) ^d	NA	Online gas detector for all nitrogen oxides at workplace
Thermal preservation of wood	A period with technical problems due to which wool piles had to be moved by hand into drying oven	Formaldehyde (CH ₂ O)	0.03–0.19 mg/m ³ (8–51)	0.56 mg/m ³ (150)	Moderate levels of formaldehyde, organic acids and VOC measured in general air outside ovens; concentration was thought to be multiple inside ovens where the patient worked without respiratory protection for 2–6 hours/day over a 9-month period
		Acetic acid (CH ₃ COOH)	0.91–7.15 mg/m ³ (7–55)	NA	
		Formic acid (HCOOH)	0.4–1.2 mg/m ³ (8–24)	NA	

		Terpenes (wood VOC)	4.2–21 mg/m ³ (3–15)	218 mg/m ³ (156)	
Veneer log processing with chemicals	Working in log incubator plant	Hydrogen sulfide (H ₂ S) ^b	NA	20–60 (400–1200)	Online gas detectors at workplace; removal of sludge from incubator wastewater located nearby, this was thought to be the main source of hydrogen sulfide
Processing PVC- fabrics	Heat seaming of large PVC-impregnated fabrics; air conditioning problems	Total VOC	3–5 mg/m ³	6.5 mg/m ³	Three asthma cases in seaming of PVC at 175 °C; measurements were taken several months after the breakout with normal air conditioning on; also several non- or mildly irritant agents were discovered in low concentrations.

OEL=occupational exposure limit, ppm=parts per million, NA=not available, EU=endotoxin unit, VOC= volatile organic compounds, PVC=polyvinyl chloride

^a Finnish OEL and if not set, other relevant European OEL

^b Measurements from company's own follow-up with on-line gas detectors

^c Only short-term (15 min) OEL set

^d Company-defined exposure limit for total oxides of nitrogen was 25 mg/m³
